U.S. Patent and Trademark Office PTOL-413B (04-03) Continuation of Substance of Interview including description of the general nature of what was discussed: The term "radical" is usually used to mean a cation, anion or lone electron in a free radical. The words before the term, hydrocarbyl, alkylene are really groups of atoms not radicals and therefore the term radical is confusing as to the metes and bounds that are being claimed. It has been agreed that the term radical will be changed to the term group by examiner's amendment. The change is only for clarity and does not change the scope of what is being claimed. The specification at the bottom of page 7 supports the term groups.
